## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Jeong, US 6,515,712 in view of Applicant's Admitted Prior Art (AAPA).

Jeong discloses that in conventional transmission systems, that linear/non-linear correction receiving unit (200 (Fig 1) generates a reference signal which has a predetermined frequency of that received from the directional coupler 160, wherein the signal is generated to offset the distorted signal output from coupler 160, by performing the 180 phase adjustment (which also includes adjusting the amplitude to that of the noise signal, since the procedure is to create the same signal which is out of phase by 180 degrees to thereby effectively remove such noise). Jeong also disclose a modulation 110 which modulates the signal output from correction unit 200 which are modulated with linear filter 112 and non-linear pre-corrector 113, which outputs a composite signal, wherein the composite signal is combined with the noise (claimed spurious) signal prior to transmission since the HPA 150 is prior to transmission. It is noted that Fig illustrates reception of MPEG-2 (which includes analog and digital data) wherein the use of digital signals is received, the signal is analog in element 112 where it is broken down into I and Q components, meeting the claimed invention.

Application/Control Number: 10/825,298

Art Unit: 2622

Although, Jeong does not explicitly recite the use of a high voltage power supply, although it is required for a HPA to receive power since the HPA is an active device (i.e.not passive). Regardless of such conventional elements/structures, the examiner will rely upon AAPA which discloses (page 3, line 8-18), where it is known to generate a signal that is a multiple of the AC line frequency.

Thus Jeong which discloses the generation of a signal to duplicate the noise signal imparted onto the composite signal prior to transmission, would duplicate the higher power voltage supply signal, if this was the element that was creating such distortion. Although, Jeong goes even further correct for all distortion prior to transmission, which meets the limitations as currently claimed, thus it would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the conventional noise offset in transmission systems with Jeong in order to isolate the noise source and provide a clean signal for transmission.

In considering claim 4

AAPA discloses the use of a LO of a conventional analog exciter circuitry. As stated above the reception of the digital MPEG signal is processed with respect to Jeong, wherein AAPA discloses the reception/processing of an analog signal (also MPEG), thus based upon the types of signals transmitted, would determine the appropriate elements (i.e. L.O, mixers etc...).

In considering claims 7-9 and 11-13,

See claim 4, In addition, the combination of Jeong/AAPA does not explicitly recite the use of a balanced modulator, however the use of such are notoriously well known in the art and available to the designer who can choose between balanced/unbalanced based upon the needs of the system, thus the examiner takes "OFFICIAL NOTICE" regarding as such.

Application/Control Number: 10/825,298

Art Unit: 2622

2. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian Yenke whose telephone number is (571)272-7359. The

examiner work schedule is Monday-Thursday, 0730-1830 hrs.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's Supervisor, John W. Miller, can be reached at (571)272-7353.

Any response to this action should be mailed to:

Commissioner of Patents and Trademarks

Washington, D.C. 20231

or faxed to:

(571)-273-8300

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Technology Center 2600 Customer Service Office whose telephone number is

(703)305-HELP.

General information about patents, trademarks, products and services offered by the United States Patent and Trademark Office (USPTO), and other related information is available by contacting the USPTO's General Information Services Division at:

800-PTO-9199 or 703-308-HELP

(FAX) 703-305-7786

(TDD) 703-305-7785

Art Unit: 2622

An automated message system is available 7 days a week, 24 hours a day providing informational responses to frequently asked questions and the ability to order certain documents. Customer service representatives are available to answer questions, send materials or connect customers with other offices of the USPTO from 8:30 a.m. - 8:00p.m. EST/EDT, Monday-Friday excluding federal holidays.

For other technical patent information needs, the Patent Assistance Center can be reached through customer service representatives at the above numbers, Monday through Friday (except federal holidays) from 8:30 a.m. to 5:00 p.m. EST/EDT.

The Patent Electronic Business Center (EBC) allows USPTO customers to retrieve data, check the status of pending actions, and submit information and applications. The tools currently available in the Patent EBC are Patent Application Information Retrieval (PAIR) and the Electronic Filing System (EFS).

PAIR (http://pair.uspto.gov) provides customers direct secure access to their own patent application status information, as well as to general patent information publicly available. EFS allows customers to electronically file patent application documents securely via the Internet. EFS is a system for submitting new utility patent applications and pre-grant publication submissions in electronic publication-ready form. EFS includes software to help customers prepare submissions in extensible Markup Language (XML) format and to assemble the various parts of the application as an electronic submission package. EFS also allows the submission of Computer Readable Format (CRF) sequence listings for pending biotechnology patent applications, which were filed in paper form.
